The Association of State and Territorial Health Officials (ASTHO) developed this toolkit in collaboration with CDC to help public health departments enhance communication and coordination around preventing healthcare-associated infections (HAIs) and reducing the spread of antibiotic resistance. This toolkit includes several resources for use across both traditional and social media channels. Health departments can use these tools to reach and engage public health and healthcare audiences, the media, and many others who are critical to raising awareness and taking steps to prevent and control HAIs. Everyone has a role to play. By working together, public health can take action to prevent HAIs and reduce the spread of antibiotic resistance to help keep all patients safe.

We invite you to personalize this toolkit by adding your organization’s logo to the front cover (at left) and adapting content to meet the needs of your state, local, and territorial audiences.

KEY MESSAGES AND TALKING POINTS

TIPS FOR WORKING WITH THE MEDIA

HOW TO SUSTAIN THE CONVERSATION ABOUT HAI PREVENTION

SOCIAL MEDIA GUIDE AND SAMPLE CONTENT

CALENDAR OF HAI-RELATED EVENTS

SUPPORTING RESOURCES
HAIs pose a serious threat to patients and can be prevented.

- HAIs are infections people get while receiving medical care in hospitals, clinics, or other healthcare facilities, which may lead to sepsis or death.
- HAIs can be caused by antibiotic-resistant bacteria, making them difficult to treat.
- Common HAIs include central line-associated bloodstream infections (CLABSI), catheter-associated urinary tract infections (CAUTI), and surgical site infections (SSI).
- In the United States, approximately one in 25 hospital patients has at least one HAI on any given day.¹
- Antibiotic-resistant bacteria cause more than 2 million illnesses and at least 23,000 deaths each year in the United States.²
- Appropriate antibiotic use is critical. Antibiotic stewardship is a set of commitments and actions to optimize infection treatment while reducing the adverse effects associated with antibiotic use.
- Antibiotic overuse contributes to growing antibiotic resistance in healthcare facilities. Antibiotic stewardship programs can help ensure hospitalized patients receive the right antibiotic, at the right dose, at the right time, and for the right duration.
- HAIs also present a significant financial burden on the healthcare system, resulting in up to $33 billion in excess medical costs every year.³
- Although progress has been made, there is still more we must do to help reduce the spread of dangerous—yet preventable—infections in healthcare settings. This includes those caused by antibiotic-resistant bacteria.

The following key messages and talking points were developed to help public health communicate about the impact of HAIs in the United States and the importance of uniting public health and healthcare partners to detect and prevent HAIs, combat antibiotic resistance, and improve antibiotic use. These messages can be tailored for use with a variety of audiences, including other public health professionals, healthcare professionals, patients, and the media.

1. **HAIs pose a serious threat to patients and can be prevented.**

2. **Public health plays a unique and valuable role in HAI prevention, using data to target prevention efforts and working with partners across the healthcare sector.**

3. **Through prevention networks, public health and healthcare work together to better prevent infections, reduce their spread, and improve antibiotic use.**

**TIP: Use available data to identify where infections occur and how patients move between facilities with high rates of infections in order to target prevention efforts. Share stories about what your health department is doing to prevent infections and protect patients.**

---

Public health plays a unique and valuable role in HAI prevention, using data to target prevention efforts and working with partners across the healthcare sector.

- Public health is in a unique position to unite the healthcare and public health communities, as well as patients and the general public, in a common goal of reducing and preventing HAIs and reducing the spread of antibiotic resistance.
- Public health helps monitor HAI prevention progress across states, territories, and local communities by using local data for local action.
- Public health works with partners to develop, refine, and implement targeted HAI prevention and antibiotic stewardship strategies, and to improve outbreak detection and response.
- In a rapidly changing healthcare delivery environment, public health is a central resource hub for credible, up-to-date, evidence-based information for HAI prevention, education, and training.
- Using strategies we know work, health departments will improve detection and response to emerging threats across healthcare and communities to control spread and protect patients.

Through prevention networks, public health and healthcare work together to better prevent infections, reduce their spread, and improve antibiotic use.

- Everyone has a part to play to create a culture of safety to help prevent HAIs, reduce antibiotic resistance, and improve outbreak response.
- Healthcare administrators and facility CEOs should establish and maintain programs focused on HAI prevention and improving antibiotic use.
- Facilities must implement and maintain systems to alert receiving facilities when transferring patients who have drug-resistant bacteria.
- Healthcare professionals should prevent infections though proper hand hygiene, responsible medical device usage, and appropriate antibiotic use.
- Public health and healthcare communities can share best practices and learn from one another to prevent HAIs and reduce the spread of antibiotic resistance.

**TIP:** Connect with other public health partners like preparedness or informatics to ensure a coordinated detection and response effort for HAI prevention. Work with academic and healthcare partners in your community to develop innovative approaches for prevention and outbreak detection in healthcare. Share outcomes of successful collaborations when communicating with new partners.

**TIP:** Share an example of an HAI prevention or outbreak response success in your jurisdiction. Is there a specific facility or organization you have partnered with that resulted in HAI reductions or rapid outbreak response and investigation?

TIPS FOR WORKING WITH THE MEDIA

If you work with the media, or if a reporter reaches out to you, use these tips to build a compelling story angle and prepare for a successful interview or conversation about HAIs and antibiotic resistance.

- **KNOW YOUR TARGET AUDIENCE.** Whom are you trying to reach with your message? This could be as broad as people in the community who might be at risk, or as specific as policymakers, healthcare administrators, hospital CEOs, physicians, nurses, or patients.

- **SHAPE YOUR ANGLE.** What makes your news story different or unique? Reporters are typically interested in stories that are relevant, timely, and important to your state, territory, or local community.

- **DO YOUR HOMEWORK.** Make sure you have a good understanding of the media outlet and reporter. What does the reporter typically write about? How have they written about HAIs previously?

- **LOCALIZE YOUR STORY.** Be sure to include local information and data as part of your pitch. For example, you could include the prevalence of HAIs in your jurisdiction, the most common infections, or real-world examples of how you are protecting patients.

- **USE SOCIAL MEDIA TO AMPLIFY YOUR MESSAGE.** Facebook and Twitter provide great platforms to share information related to HAI prevention and your news stories. Be sure to tag the outlet and reporter to help build relationships.

- **IDENTIFY AND PREPARE A SPOKESPERSON** who can speak clearly and accurately about HAIs and antibiotic resistance. For example, you could connect media with trusted partners or experts in your area who work with the health department on HAI prevention.
People often talk about HAIs in relation to major outbreaks such as Ebola and Middle East Respiratory Syndrome (MERS), but it’s important to sustain the conversation around HAIs all year long. There are many opportunities to communicate about HAI prevention and improve detection of emerging threats. Use these tips to develop a communications strategy to engage with the media, share messages on social media, and plan activities within your health department throughout the year.

**Leverage relevant events.**
Recognized public health events and awareness days, such as Sepsis Awareness Month, Get Smart About Antibiotics Week, National Patient Safety Awareness Week, and Hand Hygiene Day, provide timely opportunities to share key messages about HAIs and infection prevention.

**Share data.**
The media love data because numbers help to tell a story. Engage media to share HAI data and facts when possible, whether it’s data from your public health department, CDC, or other organizations involved in HAI prevention and detection of emerging threats. Emphasize that public health uses HAI data to target prevention activities.

**Share your success stories.**
Don’t forget to share ways your public health department or healthcare facilities in your community are taking action to prevent HAIs. Sharing your story can help others learn and take action, too.

**Connect media to patient advocates.**
When possible, help link media to patients in your community who are willing to share their personal stories. Consider engaging patients who are on the HAI Advisory Council in your state.

For a full calendar of relevant events, check out the “Calendar of HAI-related Events” in this toolkit.
Social Media: A Key Channel for Raising Awareness about HAIs, Antibiotic Resistance, Prevention Strategies, and Outbreak Response

Social media platforms provide effective channels to share important health messages and raise awareness among key audiences. For example, many public health departments successfully use Twitter and Facebook to engage the public health and healthcare communities and patients around HAI prevention, provide links to important resources and information, and spark conversations on ways to prevent HAIs and reduce the spread of antibiotic resistance.

This guide includes tips for using social media, important HAI influencers to follow, and sample tweets and Facebook posts to help health departments raise awareness of HAI prevention and antibiotic resistance on social media.

Engaging on Social Media

- **Post when your audience is most active online to increase engagement.** For Twitter and Facebook, the best time to post is typically between 1 p.m. and 4 p.m.

- **Use trending hashtags related to HAI prevention and outbreak response**, such as #PublicHealthProtects. If you create a new hashtag, use it consistently.

- **Be clear and concise.** The shorter the post, the easier it is for your audience to read. Twitter only allows 140 characters per tweet (including links and images), so be sure to factor that in as you draft content.

- **Include calls to action.** Ask your audience to read an article, come to an event, or share content with a friend—just be sure to direct them to do something. Providing clear, direct calls to action helps motivate audiences to engage.

- **Post regularly.** Maintain a regular posting schedule for your channels, to keep conversations going and your pages up to date.

- **Use visuals.** Infographics and photos are a great way to increase interaction.

- **Engage with others** by liking, sharing, retweeting, or replying to posts from users in your social network.
Facebook

Facebook is best used for community building and engagement, asking questions, promoting events, and sharing information in longer layouts. You can use Facebook to educate others about HAIs and antibiotic resistance, as well as inspire the public health and healthcare communities, and the general public, to take action to prevent HAIs and reduce the spread of antibiotic resistance.

Twitter

Twitter is best used for brief commentary on breaking news, interesting links, quick tidbits of information, and connecting with others in real time. Twitter provides a great platform for sharing HAI and antibiotic resistance news, helpful resources, and general messaging to encourage the public health and healthcare communities, and the general public, to take action against HAIs.
