ASTHO Vector-Borne Disease GIS Training Workshop

June 16-17, 2020, Portland, Oregon

ASTHO is excited to announce a two-day vector-borne disease surveillance workshop facilitated by our partners at Esri. The workshop will be limited to 15 attendees and will be led by Esri instructors on the ArcGIS platform.

This training is a hands-on workshop for field data collection and management using ArcGIS field productivity applications. Participants will also learn how to configure applications into vector-specific solutions to generate and manage work assignments, collect data, and visualize information to monitor and manage disease spread.

This workshop is open to vector-borne disease professionals at state or territorial health agencies. Participants should have basic knowledge of surveillance and/or GIS applications. A laptop is recommended but not required, as we will be able to provide laptops if needed. Pre-installed ArcGIS software is also not necessary.

If you are interested in attending, please send a short statement of need (Max. 250 words) with your professional CV by COB Friday, April 3rd to Courtney Youngbar (cyoungbar@astho.org).
